

NAME

show-pdf-tags – show the internal Structure Tree of a tagged PDF file

SYNOPSIS

show-pdf-tags [*<options>*] *<PDF-File>*

DESCRIPTION

The **show-pdf-tags** script shows the internal Structure Tree of a tagged PDF File.

The structure may be shown using an indented tree display using Unicode line characters, or as XML, or (primarily for debugging) as a linearisation of the Lua table structure obtained from the PDF file.

The XML display will use element names matching the names of the structure elements unless the **--map** option is used, in which case the standard PDF Structure element names will be used, as specified in the role mapping in the file.

It accepts a single PDF File and outputs to the standard output stream.

Valid *<options>* are:

- help|-h** Prints this message and exits
- ignore-case** Ignore case when sorting directory listing
- tree** (default) Show as tree
- xml** Show as XML
- table** Show Lua table structure
- map** Follow role mapping (xml printer)
- xmp** Include XMP XML (xml printer)
- w3c-** Add - to w3c namespaces to force browser display
